

SwiftWing Sirius NDR

Capture anything. Capture everything.

Ultra High-Performance 10M to 100G deep packet capture and storage solution Designed to meet today's demand for high speed and high quality ethernet based packet recording on IP networks.

The maximum storage performance is measured up to 200Gbps for the consideration of multiple network streams to be recorded.

Total flexibility on recording configuration with multiple media rates support, multiple capture adapters attachment.

SwiftWing Sirius NDR now supports 10M / 100M / 1G / 10G / 25G / 40G / 100G ethernet.

Rich functionality that compliment user's demand for network record, storage and analysis.

# SwiftWing SIRIUS Benefits

Works seamlessly with industry leading network monitoring and analytic solutions.

Captures and stores data in standard PCAP and nanoseconds PCAP format which can be conveniently used by all other network monitoring, analysis tools and applications available in the market today.

Ease-of-use to perform targeted tasks and selections

- Intuitive graphical user interface for complete controls and flexible system configurations.
- Robust and flexible hardware filtering function to both the packet header and payload during the capture process with no impact to the capture performance.

Scalable Solutions

- Complete range of products from rack-mounted to portable systems.
- Customizable storage configurations.

The Sirius NDR Portable is the perfect mobile solution for on-demand packet capture, with 10M/100M/1G/10G/ 25G/40G/100G interfaces, capable of 100Gbps line-rate capture performance. (Portable L)

Available with a storage capacity up to massive 200Terabyte.

Porte Compact Portable SwiftWing Sirius NDR

SIRIUS

The Sirius NDR Portable Compact is a ultracompact, most portable system with 10M/100M/ 1G/10G/25G/40G/100G Interfaces, ensuring at up to 50Gbps accurate line-rate capture & storage.

> Storage capacity starts 6Terabyte.

The SwiftWing NDR Sirius stationary appliances for most demanding tasks at Enterprise or Datacenter level supports maximum of 200Gbps storage performance.

29" Stationary Appliances

This is a line of 19" systems, scalable by speed (10M/100M/1G/10G/25G/40G/100G) and storage capacity up to massive 12Petabyte.

#### **Key Features**

Support long term Real-time Packet Replay. Captured data can be replayed according to the time stamp of the PCAP file.

One Sirius can capture four different traffic simultaneously. (Maximum of 4 channels) (Figure. 4)

Intuitive and easy-to-use interface across all desktops & mobile devices.

Easy to use and intuitive software filtering allows fast extraction of target packets. (Figure. 11)

Microseconds statistics allow in-depth microburst analysis.

Support 10/100M/1G/10G/25G/ 40G/100G Ethernet. Maximum of storage performance is over 200Gpbs.

Powerful capture configuration that supports packet slicing, file rotation and data protection mechanism.

RESTful API for remote access to stored data, pcap files and statistics. Enables integration with 3rd party appliances and custom.

Real-time and historical packet statistics and graph displays.

Support analysis of captured traffic by application and IPv4 address pair.

Sirius NDR produces list of PCAP files chronologically on system drives. Therefore, the PCAP can be served as data source for analytical tools via hypervisor or built-in Wireshark. (Figure. 1,2,3)

Built-in packet decode display allows viewing of packet data directly on the GUI.

Support SNMP traps, remote syslog, internal application log for alerts and security logging.

Support three ways of syncrhronize time : NTP, PTP and Manual setting.

|---------------|------------------------------|---|
| Profile:      | No Profile                   | ٣ |
| Offset:       | From Head of Frame 🔹 0 Bytes |   |
| Length:       | 1 v Bytes                    |   |

Figure. 10 Universal filter

Post-Filter can be applied with any values at different and multiple positions within the packet's structure.

Each search field such as IP address can accept multiple values, ranged values and aggregate with another search field, such as port numbers.

Common OSI layer protocol's header and payload are both searchable with Universal Filter. The "index" enabled post-filter dynamic structure can be defined before starting a capture.

By having Universal Filter with specific target by setting offset and length from a packet, it is an effective way to optimize search and filtering in terms of speed and volume.

#### **Channel-to-Channel Exclusive Control**

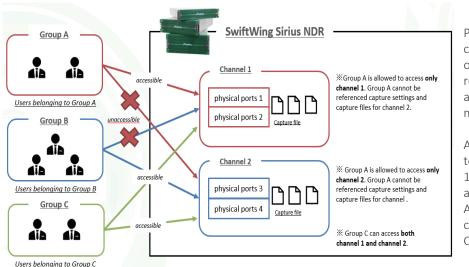

Figure. 11 Channel-to-channel exclusive control funcion

Permissions to perform key functions such as capture, capture file download, and post-filter can be assigned on a per-channel basis. Each group can manage the resources of the same chassis by physical port, allowing multiple users to use a single chassis as multiple independent capture systems.

As shown in the figure on the right, users belonging to Group A is only allowed to access physical ports 1 and 2 (channel 1), users belonging to Group B is only allowed to access physical ports 3 and 4 (channel 2). At the same time, users belonging to Group C can be configured to allow access to both Channel 1 and Channel 2.

It is also possible to flexibly assign various privileges to each group.

# Traffic Analysis

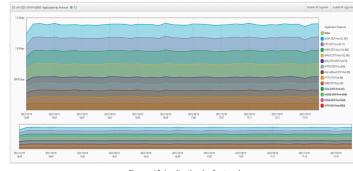

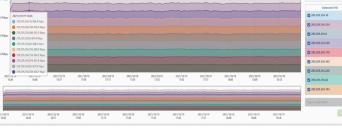

Figure. 12 Application by Protocol

Traffic analysis analyzes and graphically displays the traffic volume by application and IPv4 address pair traffic volume. By using this, the status of captured traffic can be analyzed by application and IPv4 address pair. It is very useful for understanding the overview of traffic and identifying the cause of bursts.
